

Machine Learning Engineer Nanodegree

Capstone Project

Manish Kumar September 15th, 2019

I. Definition

Project Overview

The commercialisation of the Internet and its entry into daily life along with the switch from analog to digital and the invention of the personal computer were the beginnings of the digital and technological changes that are now seen particularly within the music industry in the 21st century.

Few years ago, it was inconceivable that a person would listen to the Various Artists of choice on their morning commute. But, the glory days of Radio DJs have passed, and musical gatekeepers have been replaced with Machine Learning algorithms, continuously finding and curating new tracks and unlimited streaming services.

While an OTT music subscriber has access to all kinds of music, algorithms still struggle in some areas. Without enough data about listening pattern of the user, how would an algorithm know if the listener will like a new song or a new artist. And, how would it know what songs to recommend to a new user. Music being an 18 Billion Dollars industry, is growing as more free subscribers are converting to a paid user for the convenience of auto music curation.

Problem Statement

In this regard; at the 11th ACM International Conference on Web Search and Data Mining ([WSDM 2018](#)) presented a [Kaggle Challenge](#) to build a better music recommendation system using a donated dataset from [KKBOX](#), Asia's leading music streaming service, holding the world's most comprehensive Asia-Pop music library with over 30 million tracks.

[KKBOX](#) uses a collaborative filtering based algorithm with matrix factorization and word embedding in their recommendation system but believe new techniques could lead to better results.

In this project, I will try to predict the chances of a user listening to a song repetitively after the first observable listening event within a time window was triggered.

If there are recurring listening event(s) triggered within a month after the user's very first observable listening event, its target is marked 1, and 0 otherwise in the training set. The same rule applies to the testing set.

Metrics

In Machine Learning, performance measurement is an essential task. So when it comes to a classification problem, we can count on an AUC Curve. When we need to check or visualize the performance of the multi-class classification problem, we use AUC (Area Under The Curve) ROC (Receiver Operating Characteristics) curve. It is one of the most important evaluation metrics for checking any classification model's performance. Higher the AUC Value, better the model is at predicting 0s as 0s and 1s as 1s. In this case, Higher the AUC, better the model is at distinguishing between repeatability of a song.

$$\text{FPR} = 1 - \text{Specificity}$$

$$= \frac{\text{FP}}{\text{TN} + \text{FP}}$$

$$\text{TPR / Recall / Sensitivity} = \frac{\text{TP}}{\text{TP} + \text{FN}} \quad \text{Specificity} = \frac{\text{TN}}{\text{TN} + \text{FP}}$$

An excellent model has AUC near to the 1 which means it has good measure of separability. A poor model has AUC near to the 0 which means it has worst measure of separability. In fact it means it is reciprocating the result. It is predicting 0s as 1s and 1s as 0s. And when AUC is 0.5, it means model has no class separation capacity whatsoever.

II. Analysis

Data Exploration

From [KKBOX](#) we have training data set consisting of information of the first observable listening event for each unique user-song pair within a specific time duration. Metadata of each unique user and song pair is also provided.

The train and the test data are selected from users listening history in a given time period. The train and test sets are split based on time, and the split of public/private are based on unique user/song pairs.

Number of Unique Songs in Training Dataset: 359966

Number of Unique Songs in Testing Dataset: 224753

Number of Unique Users in Training Dataset: 30755

Number of Unique Users in Testing Dataset: 25131

Number of Unique Artists in Training Dataset: 40582

Number of Unique Artists in Testing Dataset: 27563

Number of Languages in the Training and Testing Dataset: 10

Number of Genres in Training Dataset: 572

Number of Genres in Training Dataset: 501

The Dataset has been taken from the [WSDM - KKBox's Music Recommendation Challenge](#)

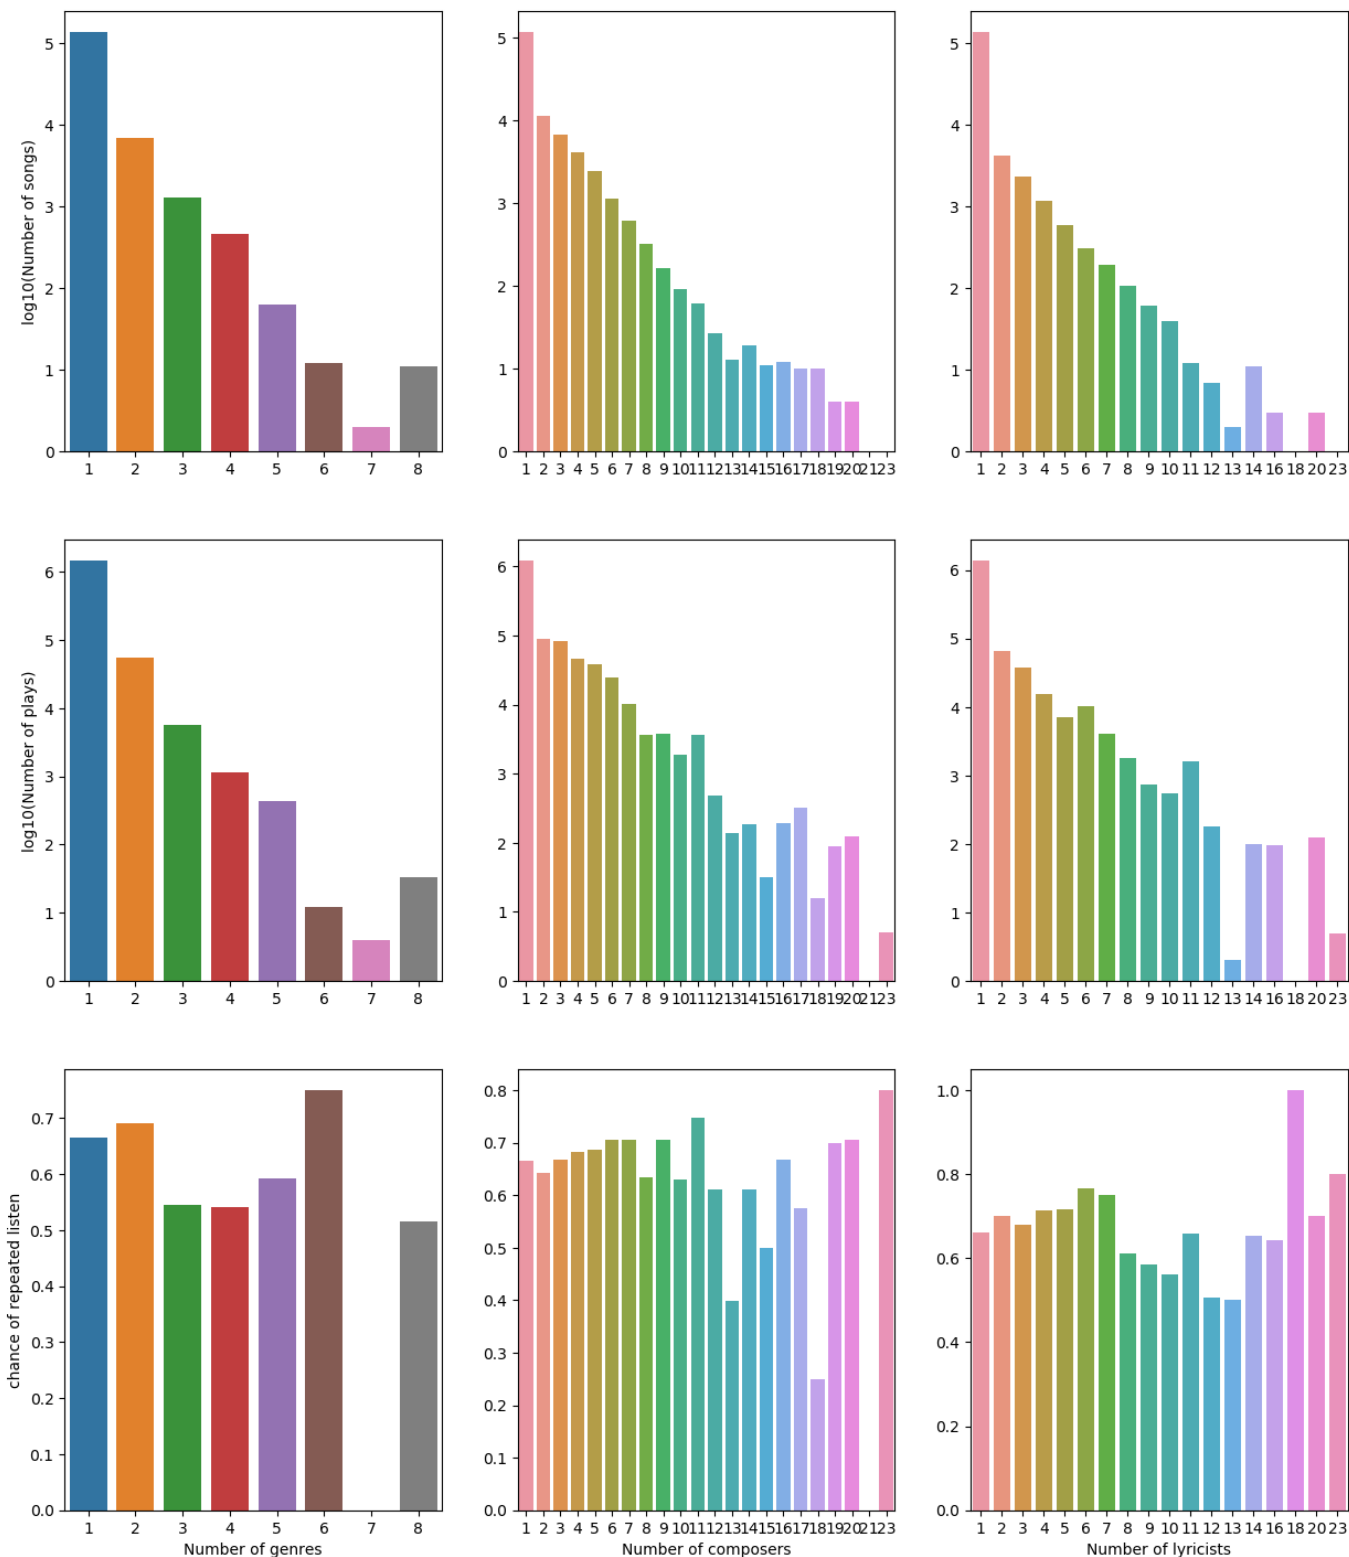

Exploratory Visualization

As part of exploratory data analysis(EDA) to see what data can reveal beyond the formal modelling, following plots were obtained. This exploration was done using the [Data Exploration Notebook](#) checked in the GitHub Repository.

Plotting Number of Plays VS Repeatability:

Plotting Genre,Composer,Lyricist Verses Repeatability of the Song:

Plotting Count Verses Duration of the Song:

Plotting Count Verses Repeatability of the Song:

Plotting Count Verses Number of Plays of the Song:

Plotting Artists Verses Number of Plays of the Song:

Plotting Repeatability Verses Number of Plays of the Song:

Plotting Track,Plays,Repeatability Verses Genre of the Song:

Plotting Plays Verses Genre of the Song:

Algorithms and Techniques

The Algorithms that I intend to use in this project is XGBOOST and CNN. XGBoost is an optimized distributed gradient boosting library designed to be highly efficient, flexible and portable. It implements machine learning algorithms under the Gradient Boosting framework. XGBoost provides a parallel tree boosting (also known as GBDT, GBM) that solve many data science problems in a fast and accurate way. XGBoost is an algorithm that has recently been dominating applied machine learning and Kaggle competitions for structured or tabular data. XGBoost is an implementation of gradient boosted decision trees designed for speed and performance. The implementation of the algorithm was engineered for efficiency of compute time and memory resources. In my case of predicting the Repeatability of the song, I will use this Algorithm to compute precision value. CNN (Convolutional neural networks) are comprised of two very simple elements, namely convolutional layers and pooling layers. Although simple, there are near-infinite ways to arrange these layers for a given problem. Fortunately, there are both common patterns for configuring these layers and architectural innovations that can be used to develop very deep convolutional neural networks. Studying these architectural design decisions developed for state-of-the-art classification tasks can provide both clarity and intuition for how to use these designs when designing a deep convolutional neural network model.

Benchmark

In this section, you will need to provide a clearly defined benchmark result or threshold for comparing across performances obtained by your solution. The reasoning behind the benchmark (in the case where it is not an established result) should be discussed. Questions to ask yourself when writing this section:

- *Has some result or value been provided that acts as a benchmark for measuring performance?*

- Is it clear how this result or value was obtained (whether by data or by hypothesis)? To create a Benchmark model as mentioned above, I would be using XGBOOST algorithm.
- The notebook used for this can be accessed [here](#). It starts with some data Preparation:
- Replacing NAs
 - Merging Datasets(train, songs, members)
 - Creating new features (registration_init_time_days, registration_init_time_months, registration_init_time_years and expiration_date)
 - Dropping correlated columns.
- Finding CoRelation between the features

Feature Importance

Dropping the less important columns(< 0.04).

Then using a XGBOOST Classifier with following parameters: XGBClassifier(base_score=0.5,

```
booster='gbtree', colsample_bylevel=1, colsample_bynode=1, colsample_bytree=1, gamma=0,
learning_rate=0.1, max_delta_step=0, max_depth=15, min_child_weight=5, missing=None,
n_estimators=300, n_jobs=1, nthread=None, objective='binary:logistic', random_state=0, reg_alpha=0,
reg_lambda=1, scale_pos_weight=1, seed=None, silent=None, subsample=1, verbosity=1)
```

III. Methodology

Data Preprocessing

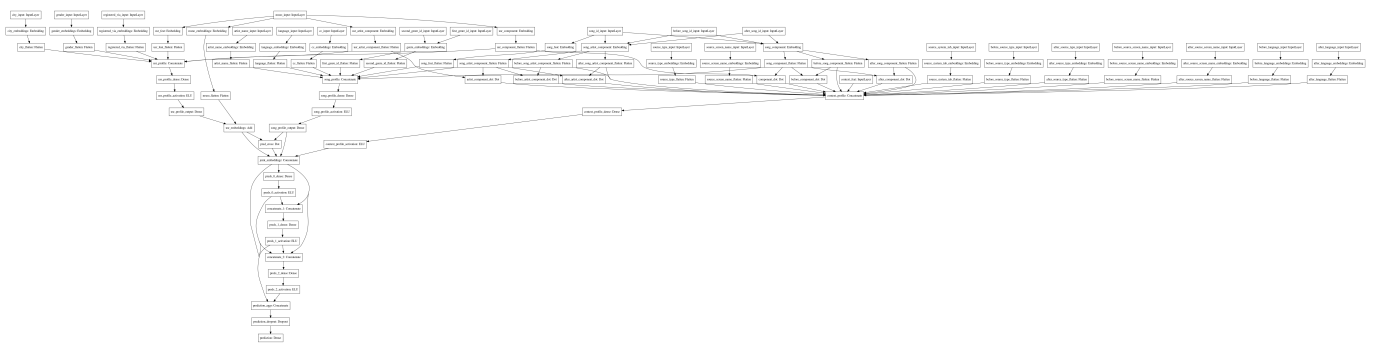

Data preprocessing is a data mining technique that involves transforming raw data into an understandable format. Real-world data is often incomplete, inconsistent, and/or lacking in certain behaviors or trends, and is likely to contain many errors. Data preprocessing is a proven method of resolving such issues. Data preprocessing prepares raw data for further processing. In my case, data obtained from [WSDM - KKBox's Music Recommendation Challenge](#) required some Data Processing as it was a direct dump from the KKBox database. I followed following processing steps to make the data suitable for the CNN that I plan to use in the next steps.

- Processing the IDs:
 - Removing the Songs IDs from Songs and song_extra_info that do not appear training, testing Dataset.
 - Applying sklearn.preprocessing.LabelEncoder on MSNO and song_id.
 - Handling Empty values and Applying LabelEncoder on Train, Test and Members Dataset.
 - Handling the Genre information in Songs dataset by IDing the genres.
 - Creating artist_cnt, lyricist_cnt, composer_cnt and is_featured in Songs Dataset.
 - Handling the empty artist_name, lyricist, composer and language and Applying LabelEncoder.
- Processing the Occurances of data:
 - Finding the count of songs wrt to user.
 - Finding the count of songs wrt to artists, composers, lyricists and genres.
 - Finding the count of songs wrt to the source on which song was played.
- Processing the ISRC(International Standard Recording Code)
 - Handling the missing ISRCs:
 - Finding count of songs as per Country Code, Registrant Code, Year of Reference and Designation Code
 - Finding count of Listens as per Country Code, Registrant Code, Year of Reference and Designation Code
- Applying SVD:
 - SVD on User-Songs Pairs
 - SVD on User-Artist Pairs
- Feature engineer the time stamp for some features.
- Compiling data before and after process.
- Making the data ready for Training.

Implementation

In this section, the process for which metrics, algorithms, and techniques that you implemented for the given data will need to be clearly documented. It should be abundantly clear how the implementation was carried out, and discussion should be made regarding any complications that occurred during this process. Questions to ask yourself when writing this section:

- Is it made clear how the algorithms and techniques were implemented with the given datasets or input data?
- Were there any complications with the original metrics or techniques that required changing prior to acquiring a solution?
- Was there any part of the coding process (e.g., writing complicated functions) that should be documented? Implementation was done using code which is checked in [GitHub](#). The main code is part of nn_training.py which is split into four parts:
 - Data Loading
 - Feature Preparation
 - Model Structure
 - Model Training As mentioned in the Algorithm part of the document that there are near-infinite ways to arrange these layers for a given problem, I too tried various structure with different hyper-parameters. The structure of the NN I chose to go with is:

List of Hyper-parameters are part of nn_record.csv file. For modelling I had to try various parameters till I came to a conclusion, then I chose to deliberately make the hyperparameters part of an input csv to facilitate a comparative study on the hyperparameter to choose in case we are deploying the Neural Network. I have tried to document code where ever possible for clarity in understading. During this project it dawn to me that we have used cleaned and archived data in our lessons; it took a lot of time and learning to get the Feature engineering part of the project done. Feature engineering is a part which I saw makes a lot of difference when it comes to accuracy and time of execution. Dimensionality reduction where ever required is also important using techniques like SVD. Some problem solvers on Kaggle just are able to beat other participants by using better Feature Engineering methods.

Refinement

With BenchMark model, I was able to get an accuracy of 70%, when I first started to port the solution to Neural Network, I was not able to beat the benchmark model; As I had not done any Feature Engineering on the Provided Dataset. Also, the parameters were not correctly tuned. I also employed various techniques like:

- Dynamic learning rate: whenever the loss function stopped decreasing, a learning rate drop was added.
- Weight decay: when overfitting was detected (the training and validation losses diverged too much), the weight decay rate was increased

The final TensorFlow model was derived by training in an iterative fashion, adjusting the parameters (e.g. learning rate, weight decay ratios). The final model has an accuracy of 73%.

IV. Results

(approx. 2-3 pages)

Model Evaluation and Validation

The val_auc value of the model is used to evaluate the model. Also, the final architecture has been chosen because of its performance which was tested by manipulating the structure.

The different hyper parameters are part of nn_record.csv:

```
time,mode,activation,batchnorm,K,K0,lw,lw1,lr,lr_decay,sample_weight_rate,bst_epoch,trn_loss,trn_acc,val_loss,val_auc 2019-09-20

13:52:48,nn_dot,tanh,True,106,10,0.001520053,0,0.008778001,0.916829,0,38,0.52024,0.74107,0.59652,0.72796 2019-09-20
14:10:16,nn_dot,tanh,True,51,15,0.0008714193,0,0.01027691,0.769936,0,21,0.5345,0.72838,0.59239,0.72767
```

The different Model Structure obtained for the different hyper-parameters are available [here](#) As part of checking the robustness of the model, I had executed the same model by splitting the into halves and one forth, but still I was able to achieve AUC > 0.71.

Justification

In this section, your model's final solution and its results should be compared to the benchmark you established earlier in the project using some type of statistical analysis. You should also justify whether these results and the solution are significant enough to have solved the problem posed in the project. Questions to ask yourself when writing this section:

- *Are the final results found stronger than the benchmark result reported earlier?*
- *Have you thoroughly analyzed and discussed the final solution?*
- *Is the final solution significant enough to have solved the problem?* As noted above I chose to use XGBOOST for its speed and efficiency.

With this I was able to get

V. Conclusion

(approx. 1-2 pages)

Free-Form Visualization

In this section, you will need to provide some form of visualization that emphasizes an important quality about the project. It is much more free-form, but should reasonably support a significant result or characteristic about the problem that you want to discuss. Questions to ask yourself when writing this section:

- Have you visualized a relevant or important quality about the problem, dataset, input data, or results?
- Is the visualization thoroughly analyzed and discussed?
- If a plot is provided, are the axes, title, and datum clearly defined?

Reflection

In this section, you will summarize the entire end-to-end problem solution and discuss one or two particular aspects of the project you found interesting or difficult. You are expected to reflect on the project as a whole to show that you have a firm understanding of the entire process employed in your work. Questions to ask yourself when writing this section:

- *Have you thoroughly summarized the entire process you used for this project?*
- *Were there any interesting aspects of the project?*
- *Were there any difficult aspects of the project?*
- *Does the final model and solution fit your expectations for the problem, and should it be used in a general setting to solve these types of problems?*

Improvement

In this section, you will need to provide discussion as to how one aspect of the implementation you designed could be improved. As an example, consider ways your implementation can be made more general, and what would need to be modified. You do not need to make this improvement, but the potential solutions resulting from these changes are considered and compared/contrasted to your current solution. Questions to ask yourself when writing this section:

- *Are there further improvements that could be made on the algorithms or techniques you used in this project?*
- *Were there algorithms or techniques you researched that you did not know how to implement, but would consider using if you knew how?*
- *If you used your final solution as the new benchmark, do you think an even better solution exists?*

Before submitting, ask yourself. . .

- Does the project report you've written follow a well-organized structure similar to that of the project template?
- Is each section (particularly **Analysis** and **Methodology**) written in a clear, concise and specific fashion? Are there any ambiguous terms or phrases that need clarification?
- Would the intended audience of your project be able to understand your analysis, methods, and results?
- Have you properly proof-read your project report to assure there are minimal grammatical and spelling mistakes?
- Are all the resources used for this project correctly cited and referenced?
- Is the code that implements your solution easily readable and properly commented?
- Does the code execute without error and produce results similar to those reported?
